[0040]

[0041]

#### Production of Compounds

The compounds according to the present invention may be produced, for example, according to scheme 1 and scheme 2.

[0042]

Scheme 1

[Chemical Formula 5]

Starting compounds necessary for the synthesis of the compounds according to the present invention may be commercially available, or alternatively may be produced according to a conventional process. For example, a 4-chloroquinoline derivative may be synthesized by a conventional process as described in *Org. Synth. Col. Vol. 3*, 272 (1955), *Acta Chim. Hung.*, 112, 241 (1983) or WO 98/47873. A 4-chloroquinazoline derivative may be synthesized by a conventional process as described in *J. Am. Chem. Soc.*, 68 1299 (1946) or *J. Am. Chem. Soc.*, 68, 1305 (1946).  
[0043]

Next, 4-chloroquinoline derivative or a corresponding quinazoline derivative is allowed to act on nitrophenol in the presence of a suitable solvent or in the absence of a solvent to synthesize a 4-(nitrophenoxy) quinoline derivative or a corresponding quinazoline derivative which is then stirred in a suitable solvent, for example, N, N-dimethylformamide, in the presence of a catalyst, for example, palladium hydroxide-carbon or palladium-carbon, in a hydrogen atmosphere to give a 4-(aminophenoxy) quinoline derivative or a corresponding quinazoline derivative. Alternatively, a 4-chloroquinoline derivative or a corresponding quinazoline derivative may be allowed to act on aminophenol in the presence of a base, for example, sodium hydride, to give a 4-(aminophenoxy) quinoline derivative or a corresponding quinazoline derivative.

[0044]

Scheme 2

[Chemical Formula 6]

The 4-(aminophenoxy)quinoline derivative or the corresponding quinazoline derivative thus obtained may be reacted with an acid chloride or an acid anhydride in the presence of a base, followed by reduction, for example, with lithium aluminum hydride to introduce a substituent into R<sup>9</sup> (step 1A).

[0045]

Alternatively, the 4-(aminophenoxy)quinoline derivative or the corresponding quinazoline derivative may be reacted with an aldehyde or a ketone to produce an imine, followed by reduction, for example, with sodiumboroncyanohydride to introduce a substituent into R<sup>9</sup> (step 1B).

[0046]

The derivative with a substituent introduced into  $R^9$  is allowed to act on an isocyanate derivative ( $O = C = N - R^{11}$ ) by a conventional method (step 2), and a suitable alkylating agent ( $R^{10}Hal$ ) is allowed to act in the presence of a base, for example, sodium hydride (step 3) to produce the compound of formula (I).

[0047]

Alternatively,  $R^9$  and  $R^{10}$  may also be introduced by allowing a suitable alkylating agent ( $R^9Hal$ ), ( $R^{10}Hal$ ) to act on a urea derivative, wherein  $R^9$  and/or  $R^{10}$  represent a hydrogen atom, in the presence of a base, for example, sodium hydride (steps 5 and 7).

[0048]

The urea derivative, wherein  $R^9$  and/or  $R^{10}$  represent a hydrogen atom, may be produced by allowing an isocyanate derivative to act on the 4-(aminophenoxy)quinoline derivative or the corresponding quinazoline derivative, produced in scheme 1, according to a conventional method, or by adding a triphosgene to the 4-(aminophenoxy)quinoline derivative or the corresponding quinazoline derivative in the presence of a base, for example, triethylamine, and then reacting the mixture with a suitable alkylamine ( $R^{11}NH_2$ ,  $R^{10}R^{11}NH$ ) (steps 4 and 6).

[0049]

The derivative having a specific substituent at the 7-position of the quinoline ring may be produced, for example, according to scheme 3.

[0050]

Scheme 3

[Chemical Formula 7]

A suitable substituent (for example, benzyl) may be allowed to act on a commercially available 4'-hydroxyacetophenone derivative to protect the hydroxyl group, followed by action of a nitrating agent (for example, nitric acid-acetic acid) to introduce a nitro group.

[0051]

The nitro group may be then reduced to an amino group which is then reacted with a formic ester in the presence of a base to form a quinolone ring, followed by action of a chlorinating agent, for example, phosphorus oxychloride, to produce a 4-chloroquinoline derivative.

[0052]

The 4-chloroquinoline derivative thus obtained may be allowed to act on aminophenol in the presence of a base, for example, sodium hydride, to produce a 4-(aminophenoxy) quinoline derivative.

[0053]

The urea portion may be synthesized by allowing an isocyanate derivative ( $O = C = N - R^{29}$ ) to act on the derivative thus obtained according to a conventional method, or by treating the derivative with triphosgene and then allowing an aromatic amine or alkylamine ( $R^{29}NH_2$ ) to act on the treated derivative.

[0054]

Next, the protective group (PG) for the hydroxyl group at the 7-position of the quinoline ring may be removed, followed by action of an alkyl halide ( $R^{22'}Hal$  wherein  $R^{22'}$  represents an alkyl portion when  $R^{22}$  represents alkoxy) in the presence of a base, or by action of an alcohol derivative ( $R^{22'}OH$ ) according to a conventional method, for example, Mitsunobu reaction, to produce a compound, according to the present invention, having an alkoxy group at the 7-position of the quinoline ring.

[0055]

The alkyl halide used in the substitution reaction may be commercially available or produced according to a process described, for example, in *J. Am. Chem. Soc.*, 1945, 67, 736.

[0056]

The alcohol derivative used in the substitution reaction may be commercially available or produced according to a process described, for example, in *J. Antibiot.* (1993), 46(1), 177 and *Ann. Pharm. Fr.* 1977, 35, 503.

[0057]

The derivative having a specific substituent at the 6-position of the quinoline ring may be produced using 3'-hydroxyacetophenone derivative as the starting compound according to scheme 3.

[0058]

In derivative having a specific substituent at the 7-position of the quinazoline ring may be produced according to scheme 4.

[0059]

#### Scheme 4

[Chemical Formula 8]

The 2-amino-bezoic ester derivative may be produced by esterifying a 2-nitro-benzoic acid derivative synthesized according to a method described, for example, in J. Med. Chem. 1977, 20, 146, for example, with dimethylsulfuric acid in the presence of a base, for example, potassium carbonate and then reducing the nitro group, for example, with iron/acetic acid.

[0060]

Next, the compound thus obtained may be allowed to act on formamide in the presence of a base to form a 4-quinazolone ring, followed by action of a chlorinating agent, for example, phosphorus oxychloride, to produce a 4-chloroquinazoline derivative.

[0061]

The 4-chloroquinazoline derivative thus obtained may be allowed to act on an aminophenol derivative in the presence of a base, for example, sodium hydride, to produce a 4-(aminophenoxy)quinazoline derivative.

[0062]

The urea portion may be synthesized by allowing an isocyanate derivative ( $O = C = N - R^{29}$ ) to act on the derivative thus obtained according to a conventional method, or by treating the derivative with triphosgene and then allowing an aromatic amine or alkylamine ( $R^{29}NH_2$ ) to act on the treated derivative.

[0063]

Next, the protective group (PG) for the hydroxyl group at the 7-position of the quinazoline ring may be removed, followed by action of an alkyl halide ( $R^{22}Hal$  wherein  $R^{22}$  represents an alkyl portion when  $R^{22}$  represents alkoxy) in the presence of a base, or by action of an alcohol derivative ( $R^{22}OH$ ) according to a conventional method, for example, Mitsunobu reaction, to produce a compound, according to the present invention, having an alkoxy group at the 7-position of the quinazoline ring.

[0064]

The alkyl halide and the alcohol derivative used in the substitution reaction may be commercially available or produced according to a process described in the literature referred to in the description of scheme 3.

[0065]

The derivative having a specific substituent at the 6-position of the quinazoline ring may be produced using 3-hydroxybenzaldehyde derivative as the starting compound according to scheme 4.

[0066]

Use of compounds/pharmaceutical composition

The compounds according to the present invention have inhibitory activity against tumor proliferation in vivo (see Pharmacological Test Example 3).

[0067]

Further, the compounds according to the present invention inhibit in vitro the activation of MAPK (mitogen-activated protein kinase) caused by stimulation of vascular endothelial cells with VEGF (vascular endothelial growth factor) (see Pharmacological Test Example 1). Upon the stimulation of vascular endothelial cells with VEGF, MAPK is activated by a signal transmission system downstream of the receptor, and, consequently, an increase in phosphorylated MAPK is recognized (Abedi, H. and Zachary, I., J. Biol. Chem., 272, 15442-15451 (1997)). The activation of MAPK is known to play an important role in the growth of vascular endothelial cells in angiogenesis (Merenmies, J. et al., Cell Growth & Differ., 8: 3-10 (1997)); and Ferrara, N. and Davis-Smyth, T., Endocr. Rev., 18, 4-25 (1997)). Therefore, the compounds according to the present invention have angiogenesis inhibitory activity.

[0068]

Angiogenesis at pathologic sites is deeply involved mainly in diseases, such as tumor, diabetic retinopathy, chronic rheumatism, psoriasis, atherosclerosis, and Kaposi's sarcoma, and metastasis of solid tumors (Forkman, J. Nature Med. 1: 27-31 (1995); Bicknell, R., Harris, A. L. Curr. Opin. Oncol. 8: 60-65 (1996)). Therefore, the compounds according to the present invention can be used in the treatment of diseases, such as tumor, diabetic retinopathy, chronic rheumatism, psoriasis, atherosclerosis, and Kaposi's sarcoma, and metastasis of solid tumors.

[0069]

The compounds according to the present invention have no significant

influence on cytomorphosis (see Pharmacological Test Example 2). Therefore, the compounds according to the present invention can be administered to living bodies with very excellent safety.

[0070]

According to another aspect of the present invention, there is provided a pharmaceutical composition comprising the compounds according to the present invention. The compounds according to the present invention may be used in the treatment of diseases, such as tumor, diabetic retinopathy, chronic rheumatism, psoriasis, atherosclerosis, and Kaposi's sarcoma, and metastasis of solid tumors.

[0071]

The compounds according to the present invention can be administered to human and non-human animals orally or parenterally by administration routes, for example, intravenous administration, intramuscular administration, subcutaneous administration, rectal administration, or percutaneous administration. Therefore, the pharmaceutical composition comprising as an active ingredient the compound according to the present invention is formulated into suitable dosage forms according to the administration routes.

[0072]

Specifically, oral preparations include tablets, capsules, powders, granules, and syrups, and parental preparations include injections, suppositories, tapes, and ointments.

[0073]

These various preparations may be prepared by conventional methods, for example, with commonly used components, such as excipients, disintegrants, binders, lubricants, colorants, and diluents.

[0074]

Excipients include, for example, lactose, glucose, corn starch, sorbit, and crystalline cellulose. Disintegrants include, for example, starch, sodium alginate, gelatin powder, calcium carbonate, calcium citrate, and dextrin. Binders include, for example, dimethylcellulose, polyvinyl alcohol, polyvinyl ether, methylcellulose, ethylcellulose, gum arabic, gelatin, hydroxypropylcellulose, and polyvinyl pyrrolidone. Lubricants include, for example, talc, magnesium stearate, polyethylene glycol, and hydrogenated vegetable oils.

[0075]

In preparing injections, if necessary, for example, buffers, pH adjustors, stabilizers, tonicity agents, and preservatives may be added.

[0076]

The content of the compounds according to the present invention in the pharmaceutical composition according to the present invention may vary according to the dosage form. In general, however, the contents is 0.5 to 50% by weight, preferably 1 to 20 % by weight, based on the whole composition.

[0077]

The dose may be appropriately determined in consideration of, for example, the age, weight, sex, difference in diseases, and severity of condition of patients, and the preparation may be administered, for example, in an amount of 0.1 to 100 mg/kg, preferably 1 to 50 mg/kg. This dose is administered at a time daily or divided doses of several times daily.

Pharmacological Test Example 1: Measurement of inhibitory activity against activation of MAPK within vascular endothelial cells induced by VEGF stimulation

Human funicular venous vasculae endothelial cells (purchased from Chronetics) were cultured in an EGM-2 medium (purchased from Chronetics) within an incubator containing 5% carbon dioxide until 50 to 70% confluent, and the culture was inoculated into wells, containing the same medium, in a 96-well flat-bottom plate in an amount of  $1.5 \times 10^5$  per well. After cultivation at 37°C overnight, the medium was replaced by an EBM-2 medium containing 0.5% fetal calf serum (purchased from Chronetics), followed by cultivation for 24 hr. A solution of the test compound in dimethyl sulfoxide was added to each well, and the cultivation was continued at 37°C for additional one hr. A human recombinant vascular endothelial growth factor (hereinafter abbreviated to "VEGF") was added to a final concentration of 50 ng/ml, and the stimulation of cells was carried out at 37°C for 8 min. The medium was removed, the cells were washed with phosphate buffered saline (pH 7.4), and 10 µl of a solubilization buffer (Tris buffered saline (pH 7.4) containing 1% Triton X100, 2 mM sodium orthovanadylate, and 1 mM disodium ethylenediaminetetraacetate) was then added thereto. The mixture was shaken at 4°C for one hr to solubilize the cells. An equal amount of Tris buffered saline containing 1% sodium laurylsulfate was added to and thoroughly mixed with the solution. This solution (2 µl) was adsorbed on a PVDF filter by dot blotting, and this filter was subjected to immunoblotting with anti-tyrosine phosphorylated MAPK antibody (purchased from Daiichi Pure Chemicals).

[0512]

The level of phosphorylated MAPK was quantitatively determined with a densitometer, and the percentage phosphorylated MAPK in the presence of the test compound was determined by presuming the level of phosphorylated MAPK with the addition of VEGF in the absence of the test compound to be 100% and the level of phosphorylated MAPK in the absence of the test compound and VEGF to be 0%. The test compound concentration ( $IC_{50}$ ) necessary for inhibiting 50% of the activation of MAPK was calculated based on the percentage of phosphorylated MAPK.

[0513]

The results were as summarized in Table 1.

Pharmacological Test Example 2: Karyomorphosis test

A375 human melanoma cells ( $2 \times 10^4$ ) (obtained from Japanese Foundation for Cancer Research) were inoculated on a culture slide (manufactured by Falcon) and were cultured at 37°C. After the elapse of 5 hr from the initiation of the cultivation, the test compound was added to 10 μM and 1 μM, and the cultivation was continued for additional 48 hr. After the fixation of cells, 50 μg/ml propidium iodide solution containing

ribonuclease (200 µg/ml) was added to stain nuclei. The stained nuclei were observed under a fluorescent microscope to analyze the nuclei for abnormality of karyomorphosis. The change in karyomorphosis for test compounds was evaluated as (2+) when the change in karyomorphosis of cells took place at 1 µM; was evaluated as (+) when the change in karyomorphosis of cells took place at 10 µM; and was evaluated as (-) when the change in karyomorphosis of cells did not take place at 10 µM. The results were as summarized in Table 2.

### Pharmacological Test Example 3: Antitumor effect on human glioma cells (GL07)

Human glioma cells GL07 (obtained from Central Laboratories for Experimental Animals) were transplanted into nude mice. When the tumor volume became about 100 mm<sup>3</sup>, the mice were grouped. In this case, grouping was carried out so that each group consisted of four mice and the average tumor volume was even

among the groups. The test compound was orally or intraperitoneally administered at a dose of 20 mg/kg to the test groups every day once a day for 9 days, while the medium was administered to the control group in the manner as in the test groups. The tumor growth inhibition rate (TGIR) was calculated as follows: The tumor growth inhibition rate (TGIR) =  $(1 - T_x/C_x) \times 100$  wherein  $C_x$  represents the volume of tumor at day x for the control group when the tumor volume at the day of the start of the administration was presumed to be 1; and  $T_x$  represents the volume of tumor for test compound administration group.

[0517]

The tumor growth inhibition rate for representative examples of a group of compounds according to the present invention is shown in Table 3.

## ABSTRACT

[Summary]

[Object]

An object of the present invention is to provide compounds which have antitumor activity and do not change cytomorphosis.

[Means to Solve Problems]

A compound represented by formula (I) or a pharmaceutically acceptable salt or solvate thereof:

[Chemical Formula I]

wherein

X and Z each represent CH or N;

R<sup>1-3</sup> represent H, substituted alkoxy, unsubstituted alkoxy, or the like;

R<sup>4</sup> represents H;

R<sup>5-8</sup> represent halogen, alkyl, alkoxy, alkylthio, nitro, or amino;

R<sup>5-8</sup> do not simultaneously represent H;

R<sup>9</sup> and R<sup>10</sup> represent H, alkyl, alkylcarbonyl; and

R<sup>11</sup> represents alkyl, alkenyl, alkynyl, or aralkyl.
